NEW ABSTRACT

Please amend the Abstract as shown in the enclosed Replacement  
Abstract.

REPLACEMENT ABSTRACT

A method of printing a patterned layer includes detecting the position and alignment of clichés supported on subbeds on the bed of a printing machine using alignment marks thereon. The positions of the subbeds are adjusted according to the detected alignment and position of the areas of the mother glass and the positions and alignment of the clichés. The clichés are then inked. Ink is transferred from the clichés, supported on the printer subbeds, onto a blanket. The material on the blanket is transferred onto the mother glass. Further, a printing machine bed includes an array of subbeds individually alignable in a common plane.
